Double Deep Pallet Rack

By placing the second row of selective pallet racks immediately behind the first row, we create Double Deep Pallet Rack. This eliminates the need for an aisle between two storage racks and saves up to 65% of the available floor space. Double-deep systems require deep-reach lift trucks.

Because it retains most of the properties of selective rack, it's possible to add decking and other accessories to a double-deep system.

Double Deep Pallet Rack

Double Deep Pallet Rack may solve your warehouse problem if you:

- Need increased storage density
- Don't need 100% immediate access to all products
- Stock rotation is less important
- Want flexibility in expanding or reconfiguring your storage
- Require an economical solution

Double Deep Pallet Rack will increase your capacity while respecting your budget.

Similar to the selective rack, double deep is available in a variety of heights, depths, bay lengths, and capacities, and can be combined with rows of pallet racks allowing us to create a customized solution for your specific needs.
