

## Pallet Flow Rack

A first-in, first-out high-density storage system, Pallet Flow Rack is an ideal solution if you need to increase the number of pallet positions and keep the ability to rotate stock.

Pallet flow works something like a conveyor system within the rack. Pallets are loaded at the charge or input end and then flow down inclined rollers to the pick faces. Available up to twenty-plus pallet positions deep, a pallet flow system dramatically increases your storage capacity.

## Pallet Flow Rack

Pallet Flow Rack may solve your problem if you:

- Need a first-in, first-out solution
- Need to maximize throughput
- Must have a good stock rotation
- Want to reduce product handling

Pallet Flow could be the answer. It's ideal for freezer warehouses, food distribution, storage of high-volume consumer goods, holding warehouses, and dispatch areas where pallets need to be removed quickly. Additionally, the system helps to keep employees at a safe distance from the forklifts that are replenishing the racks at the input end.

Have a similar need but you're moving loose cartons or split cases? A carton flow rack system may be the answer.
